Abstract

An *inversion sequence* of length n is a sequence of integers $e = e_0 \cdots e_n$ which satisfies $0 \le e_i \le i$, for all $i = 0, 1, \ldots, n$. For a set of patterns B, let $\mathbf{I}_n(B)$ be the set of inversion sequences of length n that avoid all the patterns from B. We say that two sets of patterns B and C are *I-Wilf-equivalent* if $|\mathbf{I}_n(B)| = |\mathbf{I}_n(C)|$, for all $n \ge 0$. In this paper, we show that the number of I-Wilf-equivalences among quadruples of length-3 patterns is at least 212 and at most 215, where three open cases remain.

1. Introduction

Any word $e = e_0 \cdots e_n$ such that $0 \le e_i \le i$ for all $i = 0, 1, \ldots, n$ is called an *inversion sequence* [7, 12] of length n. We denote the set of inversion sequences of length n by $\mathbf{I}_n$.

We say that a word $u = u_1 \cdots u_n$ is *order-isomorphic* to a word $v = v_1 \cdots v_n$ if for every pair of indices $i, j \in [n]$, we have $u_i < u_j$ ($u_i = u_j$) if and only if $v_i < v_j$ ($v_i = v_j$). We say that the word w *contains* a word $p = p_1 \cdots p_k$ if w contains a subsequence of length k which is order-isomorphic to p. Otherwise, we say that w *avoids* p. We denote the set of all inversion sequences of length n that avoid a pattern p by $\mathbf{I}_n(p)$. For a set of patterns P, define $\mathbf{I}_n(P) = \cap_{p \in P} \mathbf{I}_n(p)$, for all $n \ge 0$. We say that two sets of patterns P and Q are *I-Wilf-equivalent*, and we write $P \overset{\mathbf{I}}{\sim} Q$, if $|\mathbf{I}_n(P)| = |\mathbf{I}_n(Q)|$, for all $n \neq 0$.

Pattern avoidance in inversion sequences was initiated in [7, 12]. Subsequently, several researchers studied the number of I-Wilf-equivalences for single, pairs of, and triples of length-3 patterns:

DOI: 10.5281/zenodo.8399694

- Martinez and Savage [14] generalized and extended the notion of pattern-avoidance for inversion sequences to triples of binary relations that led to new conjectures and open problems. In particular, some of these results are related to quadruples of length-3 patterns as mentioned in Table 1 (also, see [6]). Most conjectures in this work have been solved in [1,6,9,10], where both generating functions and bijections were employed.

- The results of [2,5,14,16] determined all the I-Wilf-equivalence classes of pairs of length-3 patterns. So, it showed that there are 48 Wilf classes among 78 pairs of length-3 patterns (see [16]); for a complete list of the classes with open cases in terms of enumeration, see Tables 1 and 2 in [16]. Kotsireas, Mansour, and Yıdırım [8] enumerated some of these open cases (see Remark 1).

- Callan, Jelínek, and Mansour [3] showed that the number of I-Wilf-equivalence classes among triples of length-3 patterns is 137, 138 or 139. In particular, it remains to prove $\{101, 102, 110\} \overset{\mathbf{I}}{\sim} \{021, 100, 101\}$ and $\{100, 110, 201\} \overset{\mathbf{I}}{\sim} \{100, 120, 210\}$.

We refer the reader to [3] and references therein. The aim of this paper is to prove the following result.

Theorem 1. *The number of I-Wilf-equivalence classes among quadruple length-3 patterns is at least* 212 *and at most* 215*.*

Based on numerical results (see Table 2) and Theorem 1, we conjecture the following.

Conjecture 1. We conjecture

- Class 152: $\{010, 100, 102, 210\} \overset{\mathbf{I}}{\sim} \{011, 201, 210\}$;

- Class 166: $\{010, 100, 110, 201\} \overset{\mathbf{I}}{\sim} \{010, 101, 120, 201\}$;

- Class 207: $\{100, 101, 110, 201\} \overset{\mathbf{I}}{\sim} \{101, 110, 120, 210\}$.

Note that we checked the conjecture up to $n = 13$ and we commented on these three cases in Table 1 as "still open". So if we assume that the conjecture is true, then Theorem 1 shows that there are exactly 212 I-Wilf-equivalence classes among quadruple length-3 patterns.

2. The Strategy to Prove Theorem 1

Define $P = \{000, 001, 010, 011, 012, 021, 100, 101, 102, 110, 120, 201, 210\}$ to be the set of all length-3 patterns. The goal of this paper (which we don't quite achieve) is to prove there are exactly 212 I-Wilf-equivalences among $B \subset P$ with $|B| = 4$. Since the number of subsets B of P with $|B| = 4$ is 715, it seems impossible to reach our goal by constructing explicit bijections between classes of inversion sequences. The way out is to combine several steps as follows.

`First step`: We find all the sequences $\{|\mathbf{I}_n(B)|\}_{n=0}^{9}$, for all $B \subset P$ with $|B| = 4$. Table 2 in the Appendix below divides the 715 4-subsets of P into 212 classes, where the first column of this table assigns the number of the class. Theorem 1 is equivalent to proving that the classes in Table 2 are exactly the I-Wilf-equivalences among quadruples of length-3 patterns.

`Second step`: Let C be any class in Table 2. We say that C is *trivial* if C contains exactly one subset. Otherwise, C is *nontrivial*. Since each trivial class in Table 2 is an I-Wilf-equivalence, we need to consider only the nontrivial classes in Table 2. There are exactly 120 trivial classes, denoted by T in the first column in Table 2. Thus, it remains to consider $212 - 120 = 92$ nontrivial classes. Table 1 below contains only the 92 nontrivial classes, whereas, in its first column, we retain the class number from Table 2.

`Third step`: Let B be any set of patterns in P. We say that B is *reducible* if there exists $C \subsetneqq B$ such that $\mathbf{I}_n(B) = \mathbf{I}_n(C)$, for all $n \geq 0$. In this context, we write $C \overset{r}{\sim} B$. Clearly, $C \overset{r}{\sim} B$ implies $C \overset{\mathbf{I}}{\sim} B$.

Theorem 2. *We have*

$$\begin{array}{lll}
\{001\} \overset{r}{\sim} \{001, 101\}, & \{001\} \overset{r}{\sim} \{001, 102\}, & \{001\} \overset{r}{\sim} \{001, 201\}, \\
\{011\} \overset{r}{\sim} \{011, 101\}, & \{011\} \overset{r}{\sim} \{011, 110\}, & \{012\} \overset{r}{\sim} \{012, 102\}, \\
\{012\} \overset{r}{\sim} \{012, 120\}, & \{021\} \overset{r}{\sim} \{021, 201\}, & \{021\} \overset{r}{\sim} \{021, 210\}.
\end{array}$$

Proof. Since the proofs are similar, we show only the equivalence $\{001\} \overset{r}{\sim} \{001, 101\}$. Clearly, $\mathbf{I}_n(\{001, 101\}) \subseteq \mathbf{I}_n(\{001\})$. So it remains to show that $\mathbf{I}_n(\{001\}) \subseteq \mathbf{I}_n(\{001, 101\})$. Let $\pi = \pi_0\pi_1 \cdots \pi_n \in \mathbf{I}_n(001)$ with $n \geq 3$ (clearly, the statement holds for $n \leq 2$) and assume that π contains 101. Thus, there exists $0 \leq i < j < k \leq n$ such that $\pi_i = \pi_k > \pi_j$. By induction we prove that $\pi_j \geq m$ and $i \geq m + 1$, for any $m = 0, 1, \ldots, n - 3$.

Clearly, the claim holds for $m = 0$. Since $\pi_0 = 0$, we have $i \geq 1$. If $\pi_j = 0$ then π contains 001 (as $\pi_0\pi_j\pi_k$), so $\pi_i > \pi_j \geq 1$ and then $i \geq 2$. So the claim holds for $m = 1$. Assume that the claim holds for m and let us prove it for $m + 1$. Suppose, for a contradiction, that $\pi \in \mathbf{I}_n(\{001\})$ is such that there exists $0 \leq i < j < k \leq n$ with $\pi_i = \pi_k > \pi_j \geq m$ and $i \geq m + 1$. Since π avoids 001, all the letters left of π_i are different, so $\pi_s = s$ for all $s = 0, 1, \ldots, m$. If $\pi_j = m$, then π contains $\pi_m\pi_j\pi_k = mm\pi_k$, that is, it contains 001. Thus, $\pi_j \geq m + 1$. Since π is an inversion sequence and $\pi_i > \pi_j$, we have $i \geq m + 2$. Hence, by induction on m, we have that π satisfies the claim for $m = n-3$, thus $\pi = 01\cdots n-3\pi_{n-2}\pi_{n-1}\pi_n$ and $\pi_n > \pi_{n-1} \geq n-3$. Since π avoids 001, we have that $\pi_{n-1} \geq n-2$, so $\pi_{n-2} > n-2$, which contradicts the fact that $\pi_s \leq s$ for all $s = 0, 1, \ldots, n$ ($\pi \in \mathbf{I}_n$). Thus, π avoids 101, which completes the proof. □

In the next theorem, we describe all the subsets of three length-3 patterns in P reducible to subsets of two length-3 patterns in P that are not obtained from Theorem 2. Here, we omit the proof.

Theorem 3. *We have*

- $\{000, 001\} \overset{r}{\sim} \{000, 001, 100\}$;
- $\{000, 011\} \overset{r}{\sim} \{000, 011, \tau\}$, *for any* $\tau = 100, 201, 210$;
- $\{000, 012\} \overset{r}{\sim} \{000, 012, \tau\}$, *for any* $\tau = 201, 210$;
- $\{000, 021\} \overset{r}{\sim} \{000, 021, 100\}$;
- $\{001, 010\} \overset{r}{\sim} \{001, 010, \tau\}$, *for any* $\tau = 021, 100, 110, 120, 210$;
- $\{001, 011\} \overset{r}{\sim} \{001, 011, 021\}$;
- $\{001, 012\} \overset{r}{\sim} \{001, 012, 021\}$;
- $\{001, 110\} \overset{r}{\sim} \{001, 110, 210\}$;
- $\{001, 120\} \overset{r}{\sim} \{001, 120, 210\}$;
- $\{010, 011\} \overset{r}{\sim} \{010, 011, 100\}$;
- $\{010, 012\} \overset{r}{\sim} \{010, 012, \tau\}$, *for any* $\tau = 101, 201$;
- $\{010, 021\} \overset{r}{\sim} \{010, 021, \tau\}$, *for any* $\tau = 100, 101, 102, 110, 120$.

In the next theorem, we describe all the reducible subsets of four length-3 patterns in P to subsets of three length-3 patterns in P that are not obtained from Theorems 2 and 3. Again, we omit the proof.

Theorem 4. *We have*

- $\{001, 011, 012\} \overset{r}{\sim} \{001, 011, 012, 210\}$;
- $\{001, 011, 100\} \overset{r}{\sim} \{001, 011, 100, 210\}$;
- $\{001, 012, 100\} \overset{r}{\sim} \{001, 012, 100, 210\}$.

Note that when we have a reducible subset of four patterns in P, we can consider the references [3, 14, 16]. These references considered the I-Wilf-equivalences and enumerations of $|\mathbf{I}_n(B)|$ whenever B is any pair or triple of length-3 patterns from P. In Table 1, for a given B in a class C, if the computations for $\mathbf{I}_n(B)$ are not simple, we write $B = B'$ and cite Theorems 2-4, where B is reducible to B'.

`Fourth step`: First, following [8], we define the generating tree (see [15]) $\mathcal{T}(B)$. Set $\mathbf{I}_B = \cup_{n=0}^{\infty}\mathbf{I}_n(B)$. The tree $\mathcal{T}(B)$ is understood to be empty if there is no inversion sequence of arbitrary length avoiding the set B, that is, $0 \in B$. Otherwise, the root can always be taken as 0. Starting with this root which stays at level 0, we construct the remainder of the nodes of the tree $\mathcal{T}(B)$ as follows: the children of $e_0e_1\cdots e_{n-1} \in \mathbf{I}_{n-1}(B)$ are obtained from the set $\{e_0e_1\cdots e_{n-1}e_n \mid e_n = 0, 1, \ldots, n\}$ by obeying the pattern-avoiding restrictions of the patterns in B.

We define an equivalence relation on nodes of $\mathcal{T}(B)$. Let $\mathcal{T}(B; e)$ be the subtree consisting of the inversion sequence e as the root and its descendants in $\mathcal{T}(B)$. We say that e is *equivalent* to e' if and only if $\mathcal{T}(B; e) \cong \mathcal{T}(B; e')$ (in the sense of plain trees). Let $\mathcal{T}'(B)$ be the same tree $\mathcal{T}(B)$ where we replace each node e by the first node $e' \in \mathcal{T}(B)$ from top to bottom and from left to right in $\mathcal{T}(B)$ such that $\mathcal{T}(B; e) \cong \mathcal{T}(B; e')$. From now on, we identify $\mathcal{T}'(B)$ with $\mathcal{T}(B)$.

We are now ready to describe the details of the fourth step which is based on the algorithm of [8]. Let C be any nontrivial class in Table 2. For each subset $B \in C$, we run the main algorithm of [8], call it Algorithm KMY, for guessing and proving (if possible) the rules of the generating tree $\mathcal{T}(B)$. Then, we translate these rules into a system of equations and we solve for $F_B(x) = \sum_{n\geq 0} |\mathbf{I}_n(B)|x^{n+1}$. For examples, we refer the reader to [3, 8, 13]. See Table 1 for all the generating trees $\mathcal{T}(B)$ that we obtained and all the corresponding generating functions $F_B(x) = \sum_{n\geq 0} |\mathbf{I}_n(B)|x^{n+1}$.

Remark 1. In [8], Kotsireas, Mansour, and Yıdırım suggested an algorithm for guessing and proving (if possible) the rules of the generating tree $\mathcal{T}(B)$. In particular, they solved six open cases (see Tables 1 and 2 in [16]) for such pattern classes: $\mathbf{I}_n(000, 021)$, $\mathbf{I}_n(102, 021)$, $\mathbf{I}_n(100, 012)$, $\mathbf{I}_n(120, 210)$, Wilf-equivalent $\mathbf{I}_n(011, 201)$ and $\mathbf{I}_n(011, 210)$, and Wilf-equivalent $\mathbf{I}_n(100, 021)$ and $\mathbf{I}_n(110, 021)$. Moreover, they extended the algorithm to the case of restricted growth sequences (for pattern avoidance on restricted growth sequences, see [11]) and presented an explicit formula for the generating function for the number of restricted growth sequences of length n that avoid either $\{12313,12323\}$, $\{12313, 12323, 12333\}$, or $\{123\cdots\ell 1\}$.

We end this section with Table 1 which presents the 92 nontrivial classes (see the second column). In the third and fourth columns of the table, we present the rules of the generating tree $\mathcal{T}(B)$ (the root is always 0) and the corresponding generating function $F_B(x)$, whenever B is any set in the first column of the table.

Table 1: Succession rules for the generating trees $\mathcal{T}'(B)$ and generating functions $F_B(x)$ for pattern set $B \in C$, where C is a class in Table 2. Note that we distinguished those pattern sets B with same generating tree by dashed lines and we denote the pattern set B at line d in class C by $C(d)$.

End of Table 1

3. Proof of Theorem 1

Let B be any set of patterns and let $\mathcal{T}(B)$ be the generating tree for the class $\mathbf{I}_B$. The *length* of a node $v \in T(B)$ is defined to be the number of letters in v. For any $k \geq 1$, let $D_k(B)$ be the multiset of all nodes of length k at level $k-1$ in $\mathcal{T}(B)$. For each node $v \in D_k(B)$, we denote the multiset of all children of v at level k in $T(B)$ by $N_k(B;v)$. A generating tree $\mathcal{T}(B)$ is said to be *d-regular* (see [13]) if there exists $k \geq 1$ such that

- the number of different nodes in $D_r(B)$ equals d, for all $r > k$;
- for any $v \in D_r(B)$ and $w \in N_r(B;v)$, the number of occurrences of w in $N_r(B;v)$ does not depend on r, whenever $r > k$.

Clearly, $\mathcal{T}(B)$ is 0-regular if and only if the set of all nodes of the generating tree $\mathcal{T}(B)$ is finite. For instance, the generating tree

$$\begin{aligned} 0^m &\rightsquigarrow (0^{m+1})(01)\cdots(0^m1), \\ 0^m1 &\rightsquigarrow (010)(0021)^{m-1}(0^m1), \\ 010 &\rightsquigarrow 010 \end{aligned}$$

is 2-regular. But the generating tree

$$\begin{aligned} 0^m &\rightsquigarrow (0^{m+1})(0^m1)\cdots(0^mm), \\ 0^mj &\rightsquigarrow (0^{m+1})(0^mj)(0^m(j+1))\cdots(0^mm), \quad 1 \leq j \leq m \end{aligned}$$

and the generating tree

$$\begin{aligned} 0^m &\rightsquigarrow (0^{m+1})(01)\cdots(0^m1), \\ 0^m1 &\rightsquigarrow (0^m1)^m(01)^2 \end{aligned}$$

are not d-regular, for any d. Several examples of d-regular generating trees are presented in [3, 8, 13] and [13] contains a five-step algorithm to obtain an explicit formula for the generating function $F_B(x)$ from a d-regular generating tree $\mathcal{T}(B)$. Accordingly, in this paper, we omit the proof details for the generating function $F_B(x)$ whenever the generating tree $\mathcal{T}(B)$ is d-regular for some d. So, we only consider the classes C in Table 1 such that there exists $B \in C$ where $\mathcal{T}(B)$ is not d-regular, for any $0 \leq d \leq 6$.

Theorem 5 (Class 63). *We have* $\{010, 011, 120, 201\} \overset{\mathbf{I}}{\sim} \{010, 011, 120, 210\}$. *Moreover, we have*

$$F_{\{010,011,120,201\}}(x) = \frac{x}{1-x} - \sum_{j\geq1} \frac{(1-x)(1-2x)x^{2j}\prod_{i=1}^{j}(x^i-2x+1)^2}{(x^{j+2}+1-2x)\prod_{i=2}^{j+1}(x^i+1-2x)\prod_{i=2}^{j+1}(x^i-(1-2x)^2)}.$$

Proof. Let $B = \{010, 011, 120, 201\}$ or $B = \{010, 011, 120, 210\}$. Then, the rules of the generating tree of $\mathcal{T}(B)$ are given by (here we used Algorithm KMY to guess and prove)

$$\begin{aligned}
a_m &\rightsquigarrow a_{m+1} b_{m,1} \cdots b_{m,m}, \\
b_{m,j} &\rightsquigarrow b_{m,j-1} \cdots b_{m+2-j,1} b_{m+1-j,1} \cdots b_{m+1-j,m+1-j},
\end{aligned}$$

where $a_m = 0^m$ and $b_{m,j} = 0^m j$ with $j = 1, 2, \ldots, m$. Define $A_m(x)$ (respectively, $B_{m,j}(x)$) to be the generating function for the number of nodes at level $n \geq 1$ for the subtree of $\mathcal{T}(B; a_m)$ (respectively, $\mathcal{T}(B; b_{m,j})$), where its root stays at level 0. Thus,

$$\begin{aligned}
A_m(x) &= x + x A_{m+1}(x) + x \sum_{j=1}^{m} B_{m,j}(x), \\
B_{m,j}(x) &= x + x \sum_{i=1}^{j-1} B_{m+i-j+1,i}(x) + x \sum_{i=1}^{m+1-j} B_{m+1-j,i}(x).
\end{aligned}$$

Define $B_m(u) = \sum_{j=1}^{m} B_{m,j}(x) u^{m-j}$, $A(v) = \sum_{m \geq 1} A_m(x) v^{m-1}$, and $B(v, u) = \sum_{m \geq 1} B_m(u) v^{m-1}$. Then, the above recurrence can be written as

$$A(v) = \frac{x}{1-v} + \frac{x}{v}(A(v) - A(0)) + x B(v, 1), \tag{1}$$

$$B(v, u) = \frac{x}{(1-v)(1-uv)} + \frac{x}{u(1-v))}(B(v, u) - B(v, 0)) + \frac{x}{1-v} B(vu, 1). \tag{2}$$

By substituting $u = x/(1-v)$ into (2), we have

$$B(v, 0) = \frac{x}{1-v-xv} + \frac{x}{1-v} B(xv/(1-v), 1).$$

Thus, by substituting $u = 1$ into (2) and then solving for $B(v, 1)$, we have

$$B(v, 1) = \frac{x(1-x-v)}{(1-v)(1-v-vx)(1-2x-v)} - \frac{x^2}{(1-v)(1-2x-v)} B(xv/(1-v), 1).$$

By iterating this equation indefinitely, we obtain for $|x| < 1$,

$$B(v, 1) = -\sum_{j \geq 0} \frac{(1-x)(1-x-v) x^{2j+1} \prod_{i=0}^{j} (vx^i - v - x + 1)^2}{\prod_{i=1}^{j+2} (vx^i + 1 - v - x) \prod_{i=1}^{j+1} (vx^i - (1-2x)(1-x-v))}.$$

Hence, by taking $v = x$, (1) gives $A(0) = \frac{x}{1-x} + x B(x, 1)$, which completes the proof. □

Theorem 6 (Class 82). *We have*

$$F_{\{011,100,102,120\}}(x) = \frac{x(1-x-x^2)}{(1+x)(1-2x)}.$$

Proof. Let $B = \{011, 100, 102, 120\}$. Then, the rules of the generating tree of $\mathcal{T}(B)$ are given by

$$
\begin{aligned}
&a_m \rightsquigarrow a_{m+1} b_{m,1} \cdots b_{m,m},\\
&b_{m,1} \rightsquigarrow c_{1,0} d_m b_{m-1,1} \cdots b_{m-1,m-1},\\
&b_{m,j} \rightsquigarrow c_{j,0} \cdots c_{j,j-2} c_{j,0} d_{m+1-j} b_{m-j,1} \cdots b_{m-j,m-j}, \quad j = 2, 3, \ldots, m-1,\\
&b_{m,m} \rightsquigarrow c_{m,0} \cdots c_{m,m-2} c_{m,0} d_1,\\
&c_{m,1} \rightsquigarrow c_{m-2,0} \cdots c_{m-2,m-4} c_{m-2,0},\\
&c_{m,j} \rightsquigarrow c_{j,0} \cdots c_{j,j-2} c_{j,0} c_{m-1-j,0} \cdots c_{m-1-j,m-3-j} c_{m-1-j,0}, \quad j = 1, 2, \ldots, m-3,\\
&c_{m,m-2} \rightsquigarrow c_{m-2,0} \cdots c_{m-2,m-4} c_{m-2,0} c_{1,0},\\
&d_m \rightsquigarrow d_m b_{m-1,1} \cdots b_{m-1,m-1},\\
&c_{1,0} \rightsquigarrow c_{1,0},
\end{aligned}
$$

where $a_m = 0^m$, $b_{m,j} = 0^m j$ with $j = 1, 2, \ldots, m$, $c_{m,j} = 0^m j0$, and $d_m = 0^m 12$. Define $A_m(x)$ (respectively, $B_{m,j}(x)$, $C_{m,j}(x)$, $D_m(x)$) to be the generating function for the number of nodes at level $n \geq 1$ for the subtree of $\mathcal{T}'(B; a_m)$ (respectively, $\mathcal{T}'(B; b_{m,j})$, $\mathcal{T}'(B; c_{m,j})$, $\mathcal{T}'(B; d_m)$), where its root stays at level 0. Thus,

$$
\begin{aligned}
A_m(x) &= x + xA_{m+1}(x) + x\sum_{i=1}^{m} B_{m,i}(x),\\
B_{m,j}(x) &= x + x\left(C_{j,0} + \sum_{i=0}^{j-2} C_{j,i}(x)\right) + xD_{m+1-j}(x) + x\sum_{i=1}^{m-j} B_{m-j,i}(x),\\
C_{m,j}(x) &= x + xC_{1,0}(x)(\delta_{j=1} + \delta_{j=m-2}) + x\left(C_{m-1-j,0}(x) + \sum_{i=0}^{m-3-j} C_{m-1-j,i}(x)\right)\\
&\qquad + x\left(C_{j,0}(x) + \sum_{i=0}^{j-2} C_{j,i}(x)\right),\\
D_m(x) &= x + xD_m(x) + x\sum_{i=1}^{m-1} B_{m-1,i}(x).
\end{aligned}
$$

Define $A(v) = \sum_{m\geq 2} A_m(x)v^{m-1}$, $B(v,u) = \sum_{m\geq 1}\sum_{j=1}^{m} B_{m,j}(x)u^{j-1}v^{m-1}$, $C(v,u) = \sum_{m\geq 2}\sum_{j=0}^{m-2} C_{m,j}(x)u^j v^{m-1}$, and $D(v) = \sum_{m\geq 1} D_m(x)v^{m-1}$. Then, the above recurrence can be written as

$$A(v) = \frac{x}{1-v} + \frac{x}{v}(A(v) - A(0)) + xB(v,1), \tag{3}$$

$$D(v) = \frac{x}{1-v} + xD(v) + xvB(v,1), \tag{4}$$

$$\begin{aligned} B(v,u) = {} & \frac{x}{(1-v)(1-uv)} + \frac{x}{1-v}(C(uv,1) + C(uv,0)) \\ & + \frac{x}{1-uv}D(v) + \frac{xv}{1-uv}B(v,1), \end{aligned} \tag{5}$$

$$\begin{aligned} C(v,u) = {} & \frac{xv}{(1-v)(1-uv)} + \frac{x^2v}{1-uv} \\ & + \frac{x^2v^2u}{1-v} + \frac{xv}{1-uv}(C(v,1) + C(v,0)) + \frac{xv^2u}{1-v}(C(uv,1) + C(uv,0)). \end{aligned} \tag{6}$$

By taking either $u = 1$ or $u = 0$ into (6), we have a system of equations with variables $C(v,1)$ and $C(v,0)$. By solving this system, we have

$$C(v,1) = \frac{(x+1)xv}{(1-v)(1-x-2xv)}, \quad C(v,0) = \frac{(1+x-v-2vx)xv}{2v^2x + v^2 - 2vx - 2v + 1}.$$

By solving (4) for $D(v)$, we have

$$D(v) = \frac{x}{(1-v)(1-x)} + \frac{xv}{1-x}B(v,1).$$

By substituting expressions of $C(v,0)$, $C(v,1)$, and $D(v)$ into (5) with $u = 1$, and then solving for $B(v,1)$, we obtain

$$B(v,1) = \frac{x(2vx + x^2 + v - x - 1)}{(2v^2x + v^2 - 2vx - 2v + 1)(v + x - 1)}.$$

Then, by taking $u = x$ into (3) and using the expression of $B(v,1)$, we complete the proof. □

By similar arguments as in the proof of Theorem 6, we obtain the following result.

Theorem 7 (Class 90). *We have*

$$F_{\{011,102,120,201\}}(x) = F_{\{011,102,120,210\}}(x) = \frac{x(1-2x+2x^2)}{(1-x)^2(1-2x)}.$$

Moreover, the rules of the generating tree $\{011, 102, 120, 201\}$ *are given by*

$$\begin{aligned}
&a_m \rightsquigarrow a_{m+1} b_{m,1} \cdots b_{m,m},\\
&b_{m,j} \rightsquigarrow d_1^j c_{m+1-j,2} \cdots c_{m+1-j,c+2-j}, \quad j = 1, 2,\\
&b_{m,j} \rightsquigarrow d_1^2 b_{1,1} d_4 \cdots d_j c_{m+1-j,2} \cdots c_{m+1-j,m+2-j}, \quad j = 3, 4, \ldots, m-1\\
&b_{m,m} \rightsquigarrow d_1^3 b_{1,1} d_4 \cdots d_m,\\
&c_{m,j} \rightsquigarrow e_3 \cdots e_j c_{m+2-j,2} \cdots c_{m+2-j,m+3-j}, \quad j = 2, 3, \ldots, m,\\
&c_{m,m+1} \rightsquigarrow e_3 \cdots e_{m+1} d_1,\\
&d_m \rightsquigarrow d_1^2 b_{1,1} d_4 \cdots b_{m-1},\\
&e_m \rightsquigarrow e_3 \cdots e_{m-1},
\end{aligned}$$

where $a_m = 0^m$*,* $b_{m,j} = a_m j$*,* $c_{m,j} = a_m 1j$*,* $d_m = a_m m(m-1)$*, and* $e_m = a_m 1m(m-1)$*. The rules of the generating tree* $\{011, 102, 120, 210\}$ *are given by*

$$\begin{aligned}
&a_m \rightsquigarrow a_{m+1} b_{m,1} \cdots b_{m,m},\\
&b_{m,j} \rightsquigarrow d_j e_2 \cdots e_j c_{m+1-j,2} \cdots c_{m+1-j,m+2-j}, \quad j = 1, 2, \ldots, m-1,\\
&b_{m,m} \rightsquigarrow d_m e_2 \cdots e_m d_1,\\
&c_{m,j} \rightsquigarrow e_2 \cdots e_{j-1} c_{m+2-j,2} \cdots c_{m+2-j,m+3-j}, \quad j = 2, 3, \ldots, m,\\
&c_{m,m+1} \rightsquigarrow e_2 \cdots e_m d_1,\\
&d_m \rightsquigarrow d_m e_2 \cdots e_m,\\
&e_m \rightsquigarrow e_2 \cdots e_{m-1},
\end{aligned}$$

where $a_m = 0^m$*,* $b_{m,j} = a_m j$*,* $c_{m,j} = a_m 1j$*,* $d_m = a_m m0$*, and* $e_m = a_m m1$*.*

Theorem 8 **(Class 115).** *We have* $\{011, 100, 120, 201\} \overset{\mathbf{I}}{\sim} \{011, 100, 120, 210\}$*. Moreover,*

$$\begin{aligned}
&F_{\{011,100,120,201\}}(x)\\
&= \frac{x}{1-x} + \sum_{j\geq 0} \frac{x^{j+4}(1+x)^j}{(v_j + 2x - 1)(1 - v_j)^2} \prod_{i=0}^{j-1} \frac{1 - x - v_i}{(1 - v_i)(v_i + 2x - 1)(v_i x + v_i - 1)}
\end{aligned}$$

with $v_j = \frac{(1-x)x^{j+1}}{1-2x+x^{j+1}}$*.*

Proof. The rules of the generating trees

$$\mathcal{T}(\{011, 100, 120, 201\}) \text{ and } \mathcal{T}(\{011, 100, 120, 210\})$$

are given by

$$\begin{aligned}
&a_m \rightsquigarrow a_{m+1}b_{m,1}\cdots b_{m,m},\\
&b_{m,j} \rightsquigarrow c_{m+1-j}c_{m-j}b_{m+2-j,1}\cdots b_{m,j-1}b_{m-j,1}\cdots b_{m-j,m-j},\\
&b_{m,m} \rightsquigarrow c_1b_{2,1}\cdots b_{m,m-1}(012),\\
&c_m \rightsquigarrow c_mb_{m,1}\cdots b_{m,m},\\
&012 \rightsquigarrow 012,
\end{aligned}$$

where $a_m = 0^m$, $b_{m,j} = a_mj$ with $j = 1, 2, \ldots, m$, and $c_m = a_m10$. Define $A_m(x)$ (respectively, $B_{m,j}(x)$, $C_m(x)$) to be the generating function for the number of nodes at level $n \geq 1$ for the subtree of $\mathcal{T}(B; a_m)$ (respectively, $\mathcal{T}(B; b_{m,j})$, $\mathcal{T}(B; c_m)$), where its root stays at level 0. Thus,

$$\begin{aligned}
A_m(x) &= x + xA_{m+1} + x\sum_{j=1}^{m} B_{m,j}(x),\\
C_m(x) &= x + xC_m(x) + x\sum_{j=1}^{m} B_{m,j}(x),\\
B_{m,j}(x) &= x + xC_{m+1-j}(x) + xC_{m-j}(x) + x\sum_{i=1}^{m-j} B_{m-j,i}(x) + x\sum_{i=1}^{j-1} B_{m+1-j+i,i}(x),\\
B_{m,m}(x) &= x + xC_1(x) + x\sum_{i=1}^{m-1} B_{i+1,i}(x) + \frac{x^2}{1-x},
\end{aligned}$$

where $1 \leq j \leq m-1$. Define $F(v) = \sum_{m\geq 1} F_m(x)v^{m-1}$ where $F \in \{A, C\}$ and $B(v, u) = \sum_{m\geq 1}\sum_{j=1}^{m} B_{m,j}(x)u^{m-j}v^{m-1}$. Then, the above recurrence can be written as

$$\begin{aligned}
A(v) &= \frac{x}{1-v} + \frac{x}{v}(A(v) - A(0)) + xB(v, 1),\\
C(v) &= \frac{x}{1-v} + xC(v) + xB(v, 1),\\
B(v, u) &= \frac{x}{(1-v)(1-vu)} + \frac{x^2}{(1-x)(1-v)} + \frac{x}{1-v}(C(vu) + vuC(vu) + vuB(vu, 1))\\
&\quad + \frac{x}{u(1-v)}(B(v, u) - B(v, 0)).
\end{aligned}$$

By the third equation with $u = 1$, we obtain

$$B(v, 0) = -\frac{(v^2 + 2xv - 2v + 2x + 1)B(v, 1) - x^2 - x}{x(1-x)(1-v)}.$$

From the second equation, we express the function $C(v)$ in terms of $B(v, 1)$. Hence, the third equation with $u = vx/(1-x)$ gives

$$B(v, 1) = a(v)B(\frac{vx}{1-v}, 1) + b(v), \tag{7}$$

where $a(v) = \frac{x^3}{(v+2x-1)(1-v)^2}$ and $b(v) = -\frac{x(x+1)(x-1+v)}{(1-v)(v+2x-1)(vx+v-1)}$. By iterating (7) an infinite number of times (here we assumed $|x| < 1$), we have

$$B(v,1) = \sum_{j\geq 0} a\left(\frac{vx^j}{1-\frac{v(1-x^j)}{1-x}}\right)\prod_{i=0}^{j-1} b\left(\frac{vx^i}{1-\frac{v(1-x^i)}{1-x}}\right),$$

which, by the equation of $A(v)$ with $v = x$, implies $A(0) = \frac{x}{1-x} + xB(x,1)$, which completes the proof. □

Theorem 9 (Class 169). *We have* $\{010, 100, 101, 201\} \overset{\mathbf{I}}{\sim} \{010, 100, 101, 210\}$.

Proof. Let $\mathcal{T}$ be the tree with a root a_1 satisfying the following rules:

$$\begin{aligned}
&a_m \rightsquigarrow a_{m+1}a_m b_{m,2}\cdots b_{m,m},\\
&b_{m,j} \rightsquigarrow c_{m+2-j,2}\cdots c_{m,j}b_{m+1,j}b_{m,j}\cdots b_{m,m}, \quad 2 \leq j \leq m,\\
&c_{m,2} \rightsquigarrow a_m b_{m,2}\cdots b_{m,m},\\
&c_{m,j} \rightsquigarrow c_{m+3-j,2}\cdots c_{m,j-1}b_{m,j-1}\cdots b_{m,m}, \quad 3 \leq j \leq m.
\end{aligned}$$

Then $\mathcal{T}(\{010, 100, 101, 201\})$ is given by $\mathcal{T}$ with $a_m = 0^m$, $b_{m,j} = a_m j$, and $c_{m,j} = a_m j(j-1)$, and the tree $\mathcal{T}(\{010, 100, 101, 210\})$ is given by $\mathcal{T}$ with $a_m = 0^m$, $b_{m,j} = a_m j$, and $c_{m,j} = a_m j1$. Hence, $\{010, 100, 101, 201\} \overset{\mathbf{I}}{\sim} \{010, 100, 101, 210\}$. □

Remark 2. Let $B = \{010, 100, 101, 201\}$. Define $A_m(x)$ (respectively, $B_{m,j}(x)$) to be the generating function for the number of nodes at level $n \geq 1$ for the subtree of $\mathcal{T}(B; a_m)$ (respectively, $\mathcal{T}(B; b_{m,j})$), where its root stays at level 0. Moreover, let $A(v) = \sum_{m\geq 1} A_m(x)v^{m-1}$, $B(v,u) = \sum_{m\geq 2}\sum_{j=2}^{m} B_{m,j}(x)u^{m-j}v^{m-2}$, and $C(v,u) = \sum_{m\geq 2}\sum_{j=2}^{m} C_{m,j}(x)u^{m-j}v^{m-2}$. Then, the rules of the generating tree $\mathcal{T}(B)$ in the proof of Theorem 9 imply

$$\begin{aligned}
A(v) &= \frac{x}{1-v} + \frac{x}{v}(A(v) - A(0)) + xA(v) + xvB(v,1),\\
B(v,u) &= \frac{x}{(1-v)(1-vu)} + \frac{x}{1-v}C(v,u) + \frac{x}{uv}(B(v,u) - B(v,0))\\
&\quad + \frac{x}{1-u}(B(v,u) - uB(uv,1)),\\
C(v,u) &= \frac{x}{(1-v)(1-vu)} + \frac{x}{uv}(A(uv) - A(0)) + xB(uv,1) - \frac{x}{u}B(v,0)\\
&\quad + \frac{x}{u(1-v)}(C(v,u) - C(v,0)) + \frac{x}{u(1-u)}(B(v,u) - uB(uv,1)).
\end{aligned}$$

Here, we failed to derive from these equations an explicit formula for $A(0)$.

Theorem 10 (Class 172). *We have* $\{010, 100, 201, 210\} \overset{\mathbf{I}}{\sim} \{010, 101, 201, 210\}$. *Moreover,*

$$F_{\{010,100,201,210\}}(x) = \frac{K(x)}{1-K(x)},$$

where

$$K(x) = \frac{1}{4}(1+2x-x^2+(1-x)\sqrt{x^2-6x+1}) \\ - \frac{1}{2\sqrt{2}}\sqrt{(x+1)(x^2-4x+1)\sqrt{x^2-6x+1}+x^4-6x^3+4x^2-6x+1}.$$

Proof. By Table 1 (Class 172), we see that the generating tree $\mathcal{T}(\{010, 100, 201, 210\})$ is the same as the generating tree $\mathcal{T}(\{010, 101, 201, 210\})$. Define $A_m(x)$ (respectively, $B_{m,j}(x)$) to be the generating function for the number of nodes at level $n \geq 1$ for the subtree of $\mathcal{T}(B; a_m)$ (respectively, $\mathcal{T}(B; b_{m,j})$), where its root stays at level 0. Thus,

$$A_m(x) = x + xA_{m+1} + xA_m(x) + x\sum_{j=1}^{m} B_{m,j}(x),$$

$$B_{m,j}(x) = x + (j-1)xA_{m+2-j}(x) + xB_{m+1;j}(x) + x\sum_{i=j}^{m} B_{m,i}(x),$$

where $2 \leq j \leq m$.

Define $A(v) = \sum_{m\geq 1} A_m(x)v^{m-1}$ and $B(v,u) = \sum_{m\geq 2}\sum_{j=2}^{m} B_{m,j}(x)u^{m-j}v^{m-2}$. Then, the above recurrence can be written as

$$A(v) = \frac{x}{1-v} + \frac{x}{v}(A(v)-A(0)) + xA(v) + xvB(v,1), \tag{8}$$

$$B(v,u) = \frac{x}{(1-v)(1-vu)} + \frac{x}{vu(1-v)^2}(A(vu)-A(0)) \\ + \frac{x}{uv}(B(v,u)-B(v,0)) + \frac{x}{1-u}(B(v,u)-uB(vu,1)). \tag{9}$$

In order to solve (8)-(9), we **assume** that the generating functions $A(v)$ and $B(v,u)$ satisfy one extra equation

$$B(v,1) = \frac{A(v)}{1-v-\frac{1-x-\sqrt{1-6x+x^2}}{2}}. \tag{10}$$

Note that we guessed (10) by looking at the first terms of the generating function $A(v)/B(v,1)$. Hence, by (8) and (10), we have

$$\left(1-x-\frac{x}{v}-\frac{2xv}{1-2v+x+\sqrt{x^2-6x+1}}\right)A(v) = \frac{x}{1-v} - \frac{x}{v}A(0).$$

By taking $v = v_0 = K(x)$, we obtain $A(0) = \frac{v_0}{1-v_0}$, which, by using same equation, implies

$$A(v,1) \\ = \frac{x(v_0-v)(1-2v+x+\sqrt{x^2-6x+1})}{(1-v)(1-v_0)((xv-v+x)\sqrt{x^2-6x+1}+(v+1)x^2+(1-2v)x+2v^2-v)}.$$

Thus, by (10), we have

$$B(v,1) \\ = \frac{2x(v_0-v)}{(1-v)(1-v_0)((xv-v+x)\sqrt{x^2-6x+1}+(v+1)x^2+(1-2v)x+2v^2-v)}.$$

Now, by (9), we have

$$\left(1-\frac{x}{uv}-\frac{x}{1-u}\right)B(v,u) = \frac{x}{(1-v)(1-vu)} + \frac{x}{vu(1-v)^2}(A(vu)-A(0)) \\ - \frac{x}{uv}B(v,0) - \frac{xu}{1-u}B(vu,1).$$

By taking $u = u_0 = \frac{x+v-xv-\sqrt{(v-1)^2x^2-2vx+(1-2x)v^2}}{2v}$, we obtain

$$B(v,0) = \frac{vu_0}{(1-v)(1-vu_0)} + \frac{1}{(1-v)^2}(A(vu_0)-A(0)) - \frac{vu_0^2}{1-u_0}B(vu_0,1),$$

which leads to

$$B(v,u) = \frac{\frac{x}{(1-v)(1-vu)} + \frac{x}{vu(1-v)^2}(A(vu)-A(0)) - \frac{x}{uv}B(v,0) - \frac{xu}{1-u}B(vu,1)}{1-\frac{x}{uv}-\frac{x}{1-u}},$$

where we do not present the explicit expressions for $B(v,0)$ and $B(v,u)$ because they are too long.

Since $A(v)$ and $B(v,u)$ satisfy (8)-(10), this completes the proof. □

Theorem 11 (**Class 189**)**.** *We have* $\{100,102,120,201\} \overset{\mathbf{I}}{\sim} \{102,110,120,201\}$. *Moreover,*

$$F_{\{100,102,120,201\}}(x) = \frac{1-3x-x^4-(1-x-2x^3-x^4)\sqrt{1-4x}+1)}{2x^2(2+x)(1-x)^2}.$$

Proof. We proceed by finding the generating function for each class.

(1) The rules of the generating trees $\mathcal{T}(\{100,102,120,201\})$ are given by

$$\begin{aligned} &a_m \rightsquigarrow a_{m+1}b_{m,1}\cdots b_{m,m}, \\ &b_{m,j} \rightsquigarrow c_1\cdots c_j b_{m+1,j}b_{m+1-j,1}\cdots b_{m+1-j,m+1-j}, \quad 1\le j\le m, \\ &c_m \rightsquigarrow d_2\cdots d_{m-1}c_1, \\ &d_m \rightsquigarrow d_2\cdots d_{m-1}, \end{aligned}$$

where $a_m = 0^m$, $b_{m,j} = a_m j$ with $j = 1,2,\ldots,m$, $c_m = a_m m(m-1)$, and $d_m = a_m m(m-1)(m-2)$. Define $A_m(x)$ (respectively, $B_{m,j}(x)$, $C_m(x)$, $D_m(x)$) to be the generating function for the number of nodes at level $n \geq 1$ for the subtree of

$\mathcal{T}(B;a_m)$ (respectively, $\mathcal{T}(B;b_{m,j})$, $\mathcal{T}(B;c_m)$, $\mathcal{T}(B;d_m)$), where its root stays at level 0. Thus,

$$\begin{aligned}
A_m(x) &= x + xA_{m+1} + x\sum_{j=1}^{m} B_{m,j}(x),\\
B_{m,j}(x) &= x + x\sum_{i=1}^{j} C_i(x) + xB_{m+1,j}(x) + x\sum_{i=1}^{m+1-j} B_{m+1-j,i}(x),\\
C_m(x) &= x + xC_1(x) + x\sum_{i=2}^{m} D_i(x),\\
D_m(x) &= x + x\sum_{i=2}^{m-1} D_i(x),
\end{aligned}$$

where $1 \le j \le m$. Define $F(v) = \sum_{m\ge1} F_m(x)v^{m-1}$ where $F \in \{A, C\}$, $D(v) = \sum_{m\ge3} D_m(x)v^{m-2}$, $B(v,u) = \sum_{m\ge1}\sum_{j=1}^{m} B_{m,j}u^{m-j}v^{m-1}$. Then, by the fact that $C_1(x) = \frac{x}{1-x}$, the above recurrence can be written as

$$\begin{aligned}
A(v) &= \frac{x}{1-v} + \frac{x}{v}(A(v) - A(0)) + xB(v,1),\\
B(v,u) &= \frac{x(1+C(v))}{(1-v)(1-vu)} + \frac{x}{vu}(B(v,u) - B(v,0)) + \frac{x}{1-v}B(vu,1),\\
C(v) &= \frac{x}{(1-x)(1-v)} + \frac{xv}{1-v}D(v),\\
D(v) &= \frac{x}{1-v} + \frac{xv}{1-v}D(v).
\end{aligned}$$

Thus, $D(v) = \frac{x}{1-v-xv}$ and $C(v) = \frac{x(vx^2+v-1)}{(1-x)(1-v)(vx+v-1)}$. The equation of $B(v,u)$ with $u = x/v$ gives

$$B(v,0) = \frac{x(v^2x^2 + vx^3 - vx^2 - v^2 + 2v - 1)}{(1-v)^2(1-x)^2(vx+v-1)} + \frac{x}{1-v}B(x,1).$$

Therefore, by substituting expression of $B(v,0)$ into equation of $B(v,u)$ with $u = 1$ and $v = \frac{1-\sqrt{1-4x}}{2}$, we have

$$B(x,1) = \frac{x(x^2\sqrt{1-4x} - x^2 - 2)}{(x^4 - x^3 - 2x^2 + 3x - 1)\sqrt{1-4x} + x^4 + x^3 - 6x^2 + 5x - 1}.$$

Hence, by taking $v = \frac{1-\sqrt{1-4x}}{2}$ and solving for $A(0)$, we complete the proof.

(2) The rules of the generating trees $\mathcal{T}(\{102, 110, 120, 201\})$ are given by

$$\begin{aligned}
&a_m \rightsquigarrow a_{m+1}b_{m,1}\cdots b_{m,m},\\
&b_{m,j} \rightsquigarrow c_1\cdots c_j a_{m+2-j}b_{m+1-j,1}\cdots b_{m+1-j,m+1-j}, \quad 1\le j\le m,\\
&c_m \rightsquigarrow c_1(0101)^2 d_3\cdots d_m,\\
&d_m \rightsquigarrow (0101)^2 d_3\cdots d_m,\\
&0101 \rightsquigarrow 0101,
\end{aligned}$$

where $a_m = 0^m$, $b_{m,j} = a_m j$ with $j = 1, 2, \ldots, m$, $c_m = a_m m(m-1)$, and $d_m = a_m m(m-1)(m-2)$. Define $A_m(x)$ (respectively, $B_{m,j}(x)$, $C_m(x)$, $D_m(x)$) to be the generating function for the number of nodes at level $n \ge 1$ for the subtree of $\mathcal{T}(B; a_m)$ (respectively, $\mathcal{T}(B; b_{m,j})$, $\mathcal{T}(B; c_m)$, $\mathcal{T}(B; d_m)$), where its root stays at level 0. Define $B_m(x) = \sum_{j=1}^{m} B_{m,j}(x)$. Thus,

$$\begin{aligned}
A_m(x) &= x + xA_{m+1} + xB_m(x),\\
B_{m,j}(x) &= x + x\sum_{i=1}^{j} C_i(x) + xA_{m+2-j}(x) + xB_{m+1-j}(x),\\
C_m(x) &= x + \frac{2x^2}{1-x} + xC_1(x) + x\sum_{i=3}^{m} D_i(x),\\
D_m(x) &= x + \frac{2x^2}{1-x} + x\sum_{i=3}^{m-1} D_i(x),
\end{aligned}$$

where $1 \le j \le m$. Define $F(v) = \sum_{m\ge1} F_m(x)v^{m-1}$ where $F \in \{A, B, C\}$ and $D(v) = \sum_{m\ge3} D_m(x)v^{m-3}$. Then, by the fact that $C_1(x) = \frac{x}{(1-x)^2}$, the above recurrence can be written as

$$\begin{aligned}
A(v) &= \frac{x}{1-v} + \frac{x}{v}(A(v) - A(0)) + xB(v),\\
B(v) &= \frac{x}{(1-v)^2} + \frac{x}{(1-v)^2}C(v) + \frac{x}{v(1-v)}(A(v) - A(0)) + \frac{x}{1-v}B(v),\\
C(v) &= \frac{x}{(1-x)^2} + \frac{xv}{1-v}\left(1 + \frac{2x}{1-x} + \frac{x}{(1-x)^2}\right) + \frac{xv^2}{1-v}D(v),\\
D(v) &= \frac{x}{1-v} + \frac{2x^2}{(1-x)(1-v)} + \frac{xv^2}{1-v}D(v).
\end{aligned}$$

It is not hard to get explicit formulas for $D(v)$ and $C(v)$. Then by solving the second equation for $B(v)$ and substituting it into the first equation, we obtain

$$\begin{aligned}(v^2-v+x)A(v)&+(v-1)xA(0)\\&+\frac{xv(-2x^2+2x-1+(x^4+x^3+2x^2-5x+3)v)}{(vx+v-1)(1-x)^2(1-v)^2}\\&+\frac{x(1-x)^2v^3(-(2x+3)+(1+x)v)}{(vx+v-1)(1-x)^2(1-v)^2}=0.\end{aligned}$$

Hence, by taking $v=\frac{1-\sqrt{1-4x}}{2}$ and solving for $A(0)$, we complete the proof. □

Theorem 12 (**Class 208**)**.** *We have* $\{100,110,120,201\}\overset{\mathbf{I}}{\sim}\{100,110,120,210\}$. *Moreover, the generating function* $F_{\{100,110,120,201\}}(x)$ *is given by*

$$\frac{\frac{x}{1-x}+x\sum_{j\geq0}\frac{x^{2j+1}(1-w_j-x)(2(1+x)w_j^2-w_j-x)\prod_{i=0}^{j-1}(x-w_i)}{(1-w_j(1+x))\prod_{i=0}^{j}(w_i^2+(x-1)w_i+x)\prod_{i=0}^{j}(1-2w_i)\prod_{i=0}^{j}(1-w_i)}}{1-2x\sum_{j\geq0}\frac{x^{2j+1}(1-w_j-x)\prod_{i=0}^{j-1}(x-w_i)}{\prod_{i=0}^{j}(w_i^2+(x-1)w_i+x)\prod_{i=0}^{j}(1-2w_i)\prod_{i=0}^{j-1}(1-w_i)}},$$

where $w_i=\frac{x^{i+1}}{1-x(1-x^i)/(1-x)}$ *for all* $i\geq0$.

Proof. By Table 1, we see that the generating tree $\mathcal{T}(\{100,110,120,201\})$ is the same as the generating tree $\mathcal{T}(\{100,110,120,210\})$. Thus, $\{100,110,120,201\}\overset{\mathbf{I}}{\sim}\{100,110,120,210\}$. Now fix $B=\{100,110,120,201\}$ (for example). Define $A_m(x)$ (respectively, $B_{m,j}(x)$) to be the generating function for the number of nodes at level $n\geq1$ for the subtree of $\mathcal{T}'(B;a_m)$ (respectively, $\mathcal{T}'(B;b_{m,j})$), where its root stays at level 0.

Define $A(v)=\sum_{m\geq1}A_m(x)v^{m-1}$ and $B(v,u)=\sum_{m\geq1}\sum_{j=1}^{m}B_m(x)v^{m-1}u^{m-j}$. Then, as before, the rules of the generating tree $\mathcal{T}(B)$ can be written as

$$A(v)=\frac{x}{1-v}+\frac{x}{v}(A(v)-A(0))+xB(v,1), \tag{11}$$

$$\begin{aligned}B(v,u)=&\frac{x}{(1-v)(1-uv)}+\frac{2x}{uv(1-v)}(A(uv)-A(0))\\&+\frac{x}{u(1-v)}(B(v,u)-B(v,0))+\frac{x}{1-v}B(uv,1).\end{aligned}\tag{12}$$

By finding $A(v)$ from (11) and substituting it into (12) after replacing v by v/u, we obtain

$$\begin{aligned}B(v/u,u)=&\frac{x}{(1-v)^2}+\frac{2x}{(1-v)(v-x)}\left(\frac{x}{1-v}-A(0)+xB(v,1)\right)\\&+\frac{x}{u-v}(B(v/u,u)-B(v/u,0))+\frac{xu}{u-v}B(v,1).\end{aligned}\tag{13}$$

By taking $u=v+x$, we have

$$B(v/(v+x),0)=\frac{x}{(1-v)^2}+\frac{2x}{(1-v)(v-x)}\left(\frac{x}{1-v}-A(0)+xB(v,1)\right)+(v+x)B(v,1)$$

which, by replacing v with $vx/(1-v)$, implies

$$B(v,0)=\frac{(2(1+x)v^2-2(2+x)v+2)A(0)+vx-x}{(1-v)(1-2v)(1-v(1+x))} - \frac{xB(vx/(1-v),1)}{(1-v)(1-2v)}.$$

Thus, by setting $u=1$ into (12) and using expression of $B(v,0)$, we obtain

$$\begin{aligned}B(v,1)=&-\frac{(v-x)x^2}{(v^2+vx-v+x)(1-2v)(1-v)}B(vx/(1-v),1)\\&+\frac{2x(1-v-x)}{(v^2+vx-v+x)(1-2v)}A(0)\\&+\frac{x(1-v-x)(2v^2x+2v^2-v-x)}{(1-v)(1-2v)(1-v(1+x))(v^2+vx-v+x)}.\end{aligned}$$

By iterating this equation (here we assume that $|x|<1$), we have

$$\begin{aligned}B(v,1)=2A(0)&\sum_{j\geq 0}\frac{x^{2j+1}(1-v_j-x)\prod_{i=0}^{j-1}(x-v_i)}{\prod_{i=0}^{j}(v_i^2+(x-1)v_i+x)\prod_{i=0}^{j}(1-2v_i)\prod_{i=0}^{j-1}(1-v_i)}\\&+\sum_{j\geq 0}\frac{x^{2j+1}(1-v_j-x)(2(1+x)v_j^2-v_j-x)\prod_{i=0}^{j-1}(x-v_i)}{(1-v_j(1+x))\prod_{i=0}^{j}(v_i^2+(x-1)v_i+x)\prod_{i=0}^{j}(1-2v_i)\prod_{i=0}^{j}(1-v_i)}\end{aligned}$$

where $v_i=\frac{vx^i}{1-v(1-x^i)/(1-x)}$ for all $i\geq 0$.

By (11) with $v=x$, we have that $A(0)=\frac{x}{1-x}+xB(x,1)$, which completes the proof. $\square$

4. Left to Right Maximum and Combinatorial Arguments

In this section, we use bijections based on decompositions of restricted inversion sequences according to left to right maximum to finish the proof for the rest of Theorem 1. In order to do that, we need the following definitions and notation.

A *left to right maximum (LRmax)* in an inversion sequence $e=e_0e_1\dots e_n$ is an entry e_i such that $e_i\geq e_j$ for all $j<i$. If $e_i=m$ we say m is the *value* of the LRmax. Thus for $e=01102211$, the LRmax are e_0,e_1,e_2,e_4,e_5 with values $0,1,1,2,2$ respectively. So any inversion sequence $e\in\mathbf{I}_n$ can be decomposed uniquely as $m_1\pi_1\cdots m_k\pi_k$ where $m_1,\dots,m_k$ are all of the LRmax entries in e; thus $0\leq m_1\leq\cdots\leq m_k\leq n$ and $m_i>\pi_i$ (entrywise). We call this the *WLRmax* decomposition of e (W for weakly).

Say $\mathbf{m_1}<\mathbf{m_2}<\cdots<\mathbf{m_k}$ are the first occurrences of the (distinct) LRmax values of an inversion sequence e. Then e can be decomposed as $\mathbf{m_1}\boldsymbol{\pi_1}\mathbf{m_2}\boldsymbol{\pi_2}\dots\mathbf{m_k}\boldsymbol{\pi_k}$

for some $k \geq 1$ with $\mathbf{m_i} \geq \pi_\mathbf{i}$ (entrywise) for $1 \leq i \leq k$. This is the *LRmax decomposition* of e. For example, $0\,0\,0\,3\,3\,1\,3\,4\,2\,9\,3$ is an LRmax decomposition with the first occurrence of each left to right maximum value circled (except for the initial 0).

An inversion sequence e also has a unique decomposition as $e = 0^{r_1} m_2^{r_2} \pi_2 \ldots m_k^{r_k} \pi_k$ with $r_i \geq 1$ for all i where $m_2, \ldots, m_k$ are the first occurrences of the nonzero LR-max values and the first letter of π_i (if present) is less than m_i for $i = 2, \ldots, k$. We call this the *strict LRmax decomposition* of e. For example, $00033429939 = 0^3 3^2 \pi_2 4^1 \pi_3 9^2 \pi_4$ with $\pi_2 = \epsilon, \pi_3 = 2, \pi_4 = 39$.

4.1. Class 30: $\{000, 010, 101, 120\} \overset{\mathbf{I}}{\sim} \{000, 010, 110, 120\}$

By the LRmax decomposition of any inversion sequence in either $\mathbf{I}_n(\{000, 010, 101, 120\})$ or $\mathbf{I}_n(\{000, 010, 110, 120\})$, we have the following lemma.

Lemma 1. *Suppose $e \in \mathbf{I}_n$ and $\mathbf{m_1}\pi_\mathbf{1}\mathbf{m_2}\pi_\mathbf{2} \ldots \mathbf{m_k}\pi_\mathbf{k}$ is the LRmax decomposition of e. Then*

(1) $e \in \mathbf{I}_n(\{000, 010, 101, 120\})$ if and only if the following hold

(i) If a letter m_i appears in π_i, then it appears as the leftmost letter of π_i, for all $i = 1, 2, \ldots, k$;

(ii) $\mathbf{m_1}\pi_\mathbf{1} < \mathbf{m_2}\pi_\mathbf{2} < \cdots < \mathbf{m_k}\pi_\mathbf{k}$;

(iii) Each π_i avoids $\{000, 010, 101, 120\}$.

(2) $e \in \mathbf{I}_n(\{000, 010, 110, 120\})$ if and only if the following hold

(i) If a letter m_i appears in π_i, then it appears as the rightmost letter of π_i, for all $i = 1, 2, \ldots, k$;

(ii) $\mathbf{m_1}\pi_\mathbf{1} < \mathbf{m_2}\pi_\mathbf{2} < \cdots < \mathbf{m_k}\pi_\mathbf{k}$;

(iii) Each π_i avoids $\{000, 010, 110, 120\}$.

Now, we are ready to define a recursive bijection

$$f : \mathbf{I}_n(\{000, 010, 101, 120\}) \mapsto \mathbf{I}_n(\{000, 010, 110, 120\}).$$

We define $f(a) = a$, for any letter $0 \leq a \leq n$. For any inversion sequence $e \in \mathbf{I}_n(\{000, 010, 101, 120\})$ with LRmax decomposition $\mathbf{m_1}\pi_\mathbf{1} \cdots \mathbf{m_k}\pi_\mathbf{k}$, we define $f(e) = \mathbf{m_1}\beta_\mathbf{1} \cdots \mathbf{m_k}\beta_\mathbf{k}$, where

- if $\pi_i = m_i \pi_i'$, then β_i is defined to be $f(\pi_i')m_i$,
- otherwise, we define β_i as $f(\pi_i)$.

For example, if $e = 0022116655487$, then

$$f(e) = 0022f(11)66f(554)8f(7) = 0022116654587.$$

By Lemma 1, we have that $e \in \mathbf{I}_n(\{000, 010, 101, 120\})$ if and only if $f(e) \in \mathbf{I}_n(\{000, 010, 110, 120\})$.

4.2. Class 36: $\{000, 010, 100, 201\} \stackrel{\mathbf{I}}{\sim} \{000, 010, 100, 210\}$

By the WLRmax decomposition of an inversion sequence in either $\mathbf{I}_n(\{000, 010, 100, 201\})$ or $\mathbf{I}_n(\{000, 010, 100, 210\})$, we have the following lemma.

Lemma 2. *Suppose $e \in \mathbf{I}_n$ and $m_1\pi_1 m_2\pi_2 \ldots m_k\pi_k$ is the WLRmax decomposition of e. Then*
(1) $e \in \mathbf{I}_n(\{000, 010, 100, 201\})$ if any only if

(i) Each letter m_i appears at most twice as a LRmax;

(ii) All the letters in $\pi_1\pi_2 \cdots \pi_k$ are distinct;

(iii) All the letters that are smaller than m_i in $\pi_i \cdots \pi_k$ form a decreasing sequence.

(2) $e \in \mathbf{I}_n(\{000, 010, 100, 210\})$ if and only if

(i) Each letter m_i appears at most twice as a LRmax;

(ii) All the letters in $\pi_1\pi_2 \cdots \pi_k$ are distinct;

(iii) All the letters smaller than m_i in $\pi_i \cdots \pi_k$ form an increasing sequence.

Now, we are ready to define a bijection

$$f : \mathbf{I}_n(\{000, 010, 100, 201\}) \mapsto \mathbf{I}_n(\{000, 010, 100, 210\}).$$

Let $e \in \mathbf{I}_n(\{000, 010, 100, 201\})$ with WLRmax decomposition $m_1\pi_1 \cdots m_k\pi_k$. We reorder the letters of e such that $m_1, \ldots, m_k$ stay in their positions, and reorder the letters of $\pi_1 \cdots \pi_k$ such that $\pi_i \cdots \pi_k$ with $i = 1, 2, \ldots, k$ forms an increasing sequence. The result is $f(e)$. For example, if $e = 00212548893$ then $f(e) = 00212538894$. Clearly, e avoids $\{000, 010, 100, 201\}$ if and only if $f(e)$ avoids $\{000, 010, 100, 210\}$.

4.3. Class 37: $\{000, 010, 101, 201\} \stackrel{\mathbf{I}}{\sim} \{000, 010, 101, 210\}$

Using the strict LRmax decomposition, we have the following characterization of inversion sequences avoiding $\{000, 010, 101, 201\}$ and $\{000, 010, 101, 210\}$, respectively.

Lemma 3. *Suppose* $e \in \mathbf{I}_n$ *and* $0^{r_1} m_2^{r_2} \pi_2 \ldots m_k^{r_k} \pi_k$ *is the strict LRmax decomposition of* e. *Then* $e \in \mathbf{I}_n(\{000, 010, 101, 201\})$ (*resp.,* $e \in \mathbf{I}_n(\{000, 010, 101, 210\})$) *if and only if*
(*i*) *each letter in* e *appears at most twice;*
(*ii*) *if a letter* x *appears twice in* e*, then the two occurrences of* x *are adjacent;*
(*iii*) *the entries in* $\pi_i \ldots \pi_k$ *that are less than* m_i *are weakly decreasing* (*resp., weakly increasing*) *for* $i = 1, \ldots, k$.

Here is the bijection. In the strict LRmax decomposition $0^{r_1} m_2^{r_2} \pi_2 \ldots m_k^{r_k} \pi_k$ of $e \in \mathbf{I}_n(\{000, 010, 101, 201\})$, write $\pi_2 \ldots \pi_k$ as a list $a_1^{s_1} a_2^{s_2} \ldots a_\ell^{s_\ell}$ with superscripts $s_i = 2$ to indicate repeated entries (otherwise $s_i = 1$ and is omitted). For example, for

$$e = 0\,0\,2\,2\,4\,\underline{3}\,7\,\underline{6\,6}\,10\,\underline{9\,9\,8\,8\,5\,1} \in \mathbf{I}_{16}(\{000, 010, 101, 201\})$$

with the first occurrence of each nonzero LRmax circled and the π's underlined, we have $m_1 = 0$, $r_1 = 2$, $m_2 = 2$, $r_2 = 2$, $m_3 = 4$, $m_4 = 7$, $m_5 = 10$ and $\pi_2 = \epsilon$, $\pi_3 = 3$, $\pi_4 = 6\,6$, $\pi_5 = 9\,9\,8\,8\,5\,1$ and $a_1^{s_1} a_2^{s_2} \ldots a_\ell^{s_\ell} = 3\,6^2\,9^2\,8^2\,5\,1$. In the expression $a_1^{s_1} a_2^{s_2} \ldots a_\ell^{s_\ell}$, arrange $a_1, \ldots, a_\ell$ in increasing order while keeping the superscripts frozen in place. The example yields $1\,3^2\,5^2\,6^2\,8\,9$. Replace each "2" superscript with a duplicate entry to get $1\,3\,3\,5\,5\,6\,6\,8\,9$ and split this list into a new set of π's, say $(\pi_i')_{i=2}^k$ with π_i' of the same length as π_i for each i. Then the desired inversion sequence in $\mathbf{I}_n(\{000, 010, 101, 210\})$ has strict LRmax decomposition $0^{r_1} m_2^{r_2} \pi_2' \ldots m_k^{r_k} \pi_k'$. In the example, we get

$$0\,0\,2\,2\,4\,\underline{1}\,7\,\underline{3\,3}\,10\,\underline{5\,5\,6\,6\,8\,9} \in \mathbf{I}_{16}(\{000, 010, 101, 210\}) \tag{14}$$

with the first nonzero LRmax entries still circled and each π_i' underlined for clarity.

To reverse the map, list the nonempty π's as boxed entries with m_i marked above the sequence of boxes for π_i, so that each box is associated with an m_i. The preceding example (14) gives

$$\overset{4}{\boxed{1}} \quad \overset{7}{\boxed{3}\boxed{3}} \quad \overset{10}{\boxed{5}\boxed{5}\boxed{6}\boxed{6}\boxed{8}\boxed{9}}\,.$$

Now form a set S of the distinct letters in $\pi_2 \ldots \pi_k$, here $S = \{1, 3, 5, 6, 8, 9\}$, and erase the contents of the boxes, within an "x" is inserted in each box that contained the second occurrence of a repeated letter:

$$\overset{4}{\boxed{}} \quad \overset{7}{\boxed{}\boxed{x}} \quad \overset{10}{\boxed{}\boxed{x}\boxed{}\boxed{x}\boxed{}\boxed{}}\,.$$

Next, fill in the blank boxes left to right in turn with the letters of S using the largest available letter that is less than the m_i associated with the box. The example yields

$$\overset{4}{\boxed{3}} \quad \overset{7}{\boxed{6}\boxed{x}} \quad \overset{10}{\boxed{9}\boxed{x}\boxed{8}\boxed{x}\boxed{5}\boxed{1}}\,.$$

Lastly, replace each "x" with the letter immediately to its left. This yields the π_i sequence of the original inversion sequence.

4.4. Class 168: $\{010, 100, 101, 201\} \overset{\mathbf{I}}{\sim} \{010, 100, 101, 210\}$

This case is very similar to Case 37, see Subsection 4.3. Using the strict LRmax decomposition, we have the following characterization of inversion sequences avoiding $\{010, 100, 101, 201\}$ and $\{010, 100, 101, 210\}$, respectively.

Lemma 4. *Suppose $e \in \mathbf{I}_n$ and $0^{r_1} m_2^{r_2} \pi_2 \dots m_k^{r_k} \pi_k$ is the strict LRmax decomposition of e. Then $e \in \mathbf{I}_n(\{010, 100, 101, 201\})$ (respectively, $e \in \mathbf{I}_n(\{010, 100, 101, 210\})$) if and only if*
(i) the letters in $\pi_2 \dots \pi_k$ are all distinct;
(ii) no m_i appears as a letter in $\pi_2 \dots \pi_k$;
(iii) the entries in the concatenation $\pi_i \dots \pi_k$ that are less than m_i are decreasing (respectively, increasing) for $i = 1, \dots, k$.

Here is the bijection. In the strict LRmax decomposition $0^{r_1} m_2^{r_2} \pi_2 \dots m_k^{r_k} \pi_k$ of $e \in \mathbf{I}_n(\{010, 100, 101, 201\})$, rearrange (if necessary) the letters of $\pi_2 \dots \pi_k$ so that they are increasing. For example, with the π_i's underlined and the first occurrence of each nonzero LRmax circled,

$$\begin{aligned} &0\,0\,0\,3\,3\,3\,3\,\underline{2}\,7\,7\,\underline{6}\,8\,\underline{5\,4\,1} \in \mathbf{I}_{15}(\{010, 100, 101, 201\}) \\ &\quad \mapsto 0\,0\,0\,3\,3\,3\,3\,\underline{1}\,7\,7\,\underline{2}\,8\,\underline{4\,5\,6} \in \mathbf{I}_{15}(\{010, 100, 101, 210\}). \end{aligned}$$

The inverse mapping is obtained much as in Case 37 (but without the complication of repeated entries).

4.5. Class 156: $\{010, 100, 101, 120\} \overset{\mathbf{I}}{\sim} \{010, 100, 110, 120\}$

Lemma 5. *Suppose $e \in \mathbf{I}_n$ avoids 100 and b starts a 110 or 101 pattern in e. Then b is a left to right maximum in e.*

Proof. If b starts a 110 in e but is not a left to right maximum, then there is a $c > b$ and an $a < b$ such that $cbba$ is a subsequence of e. But then cbb is a forbidden 100. Similarly for 101. □

Lemma 6. *Suppose $e \in \mathbf{I}_n(\{010, 100, 120\})$ and $\mathbf{m_1}\pi_\mathbf{1}\mathbf{m_2}\pi_\mathbf{2} \dots \mathbf{m_k}\pi_\mathbf{k}$ is the LRmax decomposition of e. Then*
(i) $\mathbf{m_1}\pi_\mathbf{1} < \mathbf{m_2}\pi_\mathbf{2} < \dots < \mathbf{m_k}\pi_\mathbf{k}$ (entrywise).
(ii) If e avoids 101, then all occurrences of $\mathbf{m_i}$ in e occur as a single run at the start of $\mathbf{m_i}\pi_\mathbf{i}$, $\mathbf{1 \le i \le k}$.
(iii) If e avoids 110, then all but the first occurrence of $\mathbf{m_i}$ occur as a single (possibly vacuous) run at the end of π_i, $1 \le i \le k$.

Proof. (i) Certainly, $\mathbf{m_i}\pi_\mathbf{i} < \mathbf{m_{i+1}}$. If $a \le \mathbf{m_i}$ for some entry a in π_{i+1}, then $\mathbf{m_i}\mathbf{m_{i+1}}\mathbf{a}$ is a 120 if $a < \mathbf{m_i}$ and a 010 if $a = \mathbf{m_i}$. Parts (ii) and (iii) are clear. □

In view of Lemmas 5 and 6, the following is a bijection from $\mathbf{I}_n(\{010, 100, 101, 120\})$ to $\mathbf{I}_n(\{010, 100, 110, 120\})$: in the LRmax decomposition $0\pi_1\mathbf{m_2}\pi_\mathbf{2}\dots\mathbf{m_k}\pi_\mathbf{k}$ of $e \in \mathbf{I}_n(\{010, 100, 101, 120\})$, for each $i = 2, \dots, k$, move all occurrences of $\mathbf{m_i}$ in π_i from the start of π_i to the end. For example,

$$\begin{array}{lcl} 0\,0\,0\;\;3\;\;3\,3\,2\,1\;\;6\;\;4\,5\;\;8\;\;8\,7\;\;9\;\;9\;10 & = & \\ 0\,0\,0\,3\,3\,3\,2\,1\,6\,4\,5\,8\,8\,7\,9\,9\,10 & \to & 0\,0\,0\,3\,2\,1\,3\,3\,6\,4\,5\,8\,7\,8\,9\,9\,10. \end{array}$$

To reverse the map, move all occurrences of $\mathbf{m_i}$ in π_i from the end of π_i to the start.

4.6. Class 133: $\{000, 101, 120, 201\} \stackrel{\mathbf{I}}{\sim} \{000, 101, 120, 210\}$

We have the following characterizations whose straightforward proofs are left to the reader.

Lemma 7. *Suppose $e \in \mathbf{I}_n$ and $\mathbf{m_1}\pi_\mathbf{1}\mathbf{m_2}\pi_\mathbf{2}\dots\mathbf{m_k}\pi_\mathbf{k}$ is the LRmax decomposition of e. Then $e \in \mathbf{I}_n(\{000, 101, 120, 201\})$ if and only if*
(i) $\mathbf{m_i} \le \pi_\mathbf{i+1}$ for $1 \le i \le k-1$;
(ii) each π_i is weakly decreasing;
(iii) no entry occurs three or more times;
(iv) if $e_i = m$ is both a LRmax and a descent top, then e_i is the last occurrence of m in e.

Lemma 8. *Suppose $e \in \mathbf{I}_n$ and $\mathbf{m_1}\pi_\mathbf{1}\mathbf{m_2}\pi_\mathbf{2}\dots\mathbf{m_k}\pi_\mathbf{k}$ is the LRmax decomposition of e. Then $e \in \mathbf{I}_n(\{000, 101, 120, 210\})$ if and only if*
(i) $\mathbf{m_i} \le \pi_\mathbf{i+1}$ for $1 \le i \le k-1$;
(ii) for each i, if π_i has a descent, then it has only one, it occurs right at the start and the descent top is the second occurrence of $\mathbf{m_i}$;
(iii) no entry occurs three or more times;
(iv) if $e_i = m$ is both a LRmax and a descent top, then e_i is the last occurrence of m in e.

Here is the bijection, with an obvious inverse. Given $e \in \mathbf{I}_n(\{000, 101, 120, 201\})$ with LRmax decomposition $\mathbf{m_1}\pi_\mathbf{1}\mathbf{m_2}\pi_\mathbf{2}\dots\mathbf{m_k}\pi_\mathbf{k}$, for each $i \ge 2$, reverse π_i unless the first entry of π is the second occurrence of $\mathbf{m_i}$, in which case leave this entry intact and reverse the rest of π_i. For example,

$$\begin{array}{lcl} 0\,0\;\;1\;\;1\;\;2\;\;5\;\;4\,4\,3\;\;9\;\;9\,8\,8\,7\,6\,6 & = & \\ 0\,0\,1\,1\,2\,5\,4\,4\,3\,9\,9\,8\,8\,7\,6\,6 & \to & 0\,0\,1\,1\,2\,5\,3\,4\,4\,9\,9\,6\,6\,7\,8\,8. \end{array}$$

4.7. Class 164: $\{010, 100, 120, 201\} \overset{\mathbf{I}}{\sim} \{010, 110, 120, 201\}$

We have the following characterizations.

Lemma 9. *Suppose* $e \in \mathbf{I}_n$ *and* $\mathbf{m_1}\pi_\mathbf{1}\mathbf{m_2}\pi_\mathbf{2} \dots \mathbf{m_k}\pi_\mathbf{k}$ *is the LRmax decomposition of* e. *Then* $e \in \mathbf{I}_n(\{010, 100, 120, 201\})$ *if and only if*
(i) $\mathbf{m_i} < \pi_\mathbf{i+1}$ *for* $1 \le i \le k-1$, *and*
(ii) *each* $\mathbf{m_i}\pi_\mathbf{i}$ *starts with one or more occurrences of* $\mathbf{m_i}$ *and thereafter is decreasing, except that it may end with zero or more occurrences of* m_i.

Proof. If condition (i) is not met, then either $a = m_i$ occurs in π_{i+1} and $m_i m_{i+1} a$ is a 010, or $a < m_i$ occurs in π_{i+1} and $m_i m_{i+1} a$ is a 120. If $e \in \mathbf{I}_n(\{010, 100, 120, 201\})$ and $m_i = a$ say, then the entries other than a in π_i are decreasing for otherwise, m_i starts a 100 or a 201, and all occurrences of a in π_i are at the start or the end for else a is the "2" of a 120. Thus condition (ii) holds. We leave the reader to show the converse: that if the two conditions hold, then $e \in \mathbf{I}_n(\{010, 100, 120, 201\})$. $\square$

The next lemma has an analogous proof.

Lemma 10. *Suppose* $e \in \mathbf{I}_n$ *and* $\mathbf{m_1}\pi_\mathbf{1}\mathbf{m_2}\pi_\mathbf{2} \dots \mathbf{m_k}\pi_\mathbf{k}$ *is the LRmax decomposition of* e. *Then* $e \in \mathbf{I}_n(\{010, 110, 120, 201\})$ *if and only if*
(i) $\mathbf{m_i} < \pi_\mathbf{i+1}$ *for* $1 \le i \le k-1$, *and*
(ii) *each* π_i *has the form* $m_i^r w\, m_i^t$ *with* $r, t \ge 0$, *where* $m_i > w$ *and* w *is decreasing except that the last letter of* w *may be repeated indefinitely.*

Here is the bijection, with an obvious inverse. Suppose $e \in \mathbf{I}_n(\{010, 100, 120, 201\})$ with LRmax decomposition $\mathbf{m_1}\pi_\mathbf{1}\mathbf{m_2}\pi_\mathbf{2} \dots \mathbf{m_k}\pi_\mathbf{k}$. By Lemma 9, for each $i \ge 2$, π_i has the form $m_i^r u_1 \dots u_s m_i^t$ with $m_i > u_1 > \cdots > u_s$ for some $r, s, t \ge 0$. Replace π_i with $u_1 \dots u_{s-1} u_s^{r+1} m_i^t$ if $s \ge 1$ and leave π unchanged if $s = 0$. For example,

$$0\,0\,0\,3\,3\,3\,2\,1\,3\,3\,7\,7\,6\,5\,4\,7\,8\,10\,10\,9\,10 \\ \to 0\,0\,0\,3\,2\,1\,1\,1\,3\,3\,7\,6\,5\,4\,4\,7\,8\,10\;\;9\,9\,10\,.$$

4.8. Class 166: $\{010, 101, 120, 201\} \overset{\mathbf{I}}{\sim} \{010, 101, 120, 210\}$

We have the following characterizations whose straightforward proofs are left to the reader.

Lemma 11. *Suppose* $e \in \mathbf{I}_n$ *and* $\mathbf{m_1}\pi_\mathbf{1}\mathbf{m_2}\pi_\mathbf{2} \dots \mathbf{m_k}\pi_\mathbf{k}$ *is the LRmax decomposition of* e. *Then* $e \in \mathbf{I}_n(\{010, 101, 120, 201\})$ *if and only if*
(i) *for* $1 \le i \le k-1$, *we have* $\mathbf{m_i} < \pi_\mathbf{i+1}$, *and*
(ii) *each* $\mathbf{m_i}\pi_\mathbf{i}$ *is weakly decreasing.*

Lemma 12. *Suppose* $e \in \mathbf{I}_n$ *and* $\mathbf{m_1}\pi_\mathbf{1}\mathbf{m_2}\pi_\mathbf{2} \dots \mathbf{m_k}\pi_\mathbf{k}$ *is the LRmax decomposition of* e. *Then* $e \in \mathbf{I}_n(\{010, 101, 120, 201\})$ *if and only if*

(i) for $1 \le i \le k-1$*, we have* $\mathbf{m_i} < \pi_{\mathbf{i+1}}$*, and*
(ii) for each $i \ge 2$*, all occurences of* $b := \mathbf{m_i}$ *in* π_i *occur at the start and the rest of* π_i *is weakly increasing.*

Here is the bijection, with an obvious inverse. For each π_i, set $b = \mathbf{m_i}$, leave all occurences of b at the start of π_i intact, and reverse the remainder of π_i to change it from weakly decreasing to weakly increasing. For example, with the first occurrence of each noninitial left-to-right maximum circled,

$$0\,0\,0\,3\,3\,2\,2\,2\,1\,6\,5\,4\,4 \to 0\,0\,0\,3\,3\,1\,2\,2\,2\,6\,4\,4\,5\,.$$

4.9. Class 206: $\{101, 100, 120, 201\} \overset{\mathrm{I}}{\sim} \{101, 110, 120, 201\}$

By finding the generating trees for all pairs in Class 206 (see Table 1), we can state the following result.

Theorem 13 (**Class 206**)**.** *We have*
(1) *The rules of the generating tree* $\mathcal{T}(\{100, 101, 120, 201\})$ *are*

$$\begin{aligned}
a_m &\rightsquigarrow a_{m+1} b_{m,1} \cdots b_{m,m},\\
b_{m,j} &\rightsquigarrow a_{m+1-j} c_{m+2-j,2} \cdots c_{m,j} b_{m+1,j} b_{m+1-j,1} \cdots b_{m+1-j,m+1-j}, \quad 1 \le j \le m,\\
c_{m,j} &\rightsquigarrow a^2_{m+2-j} c_{m+3-j,2} \cdots c_{m,j-1} b_{m+1-j,1} \cdots b_{m+1-j,m+1-j}, \quad 2 \le j \le m,
\end{aligned}$$

where $a_m = 0^m$*,* $b_{m,j} = a_m j$*, and* $c_{m,j} = a_m j(j-1)$*.*
(2) *The rules of the generating tree* $\mathcal{T}(\{100, 101, 120, 210\})$ *are*

$$\begin{aligned}
a_m &\rightsquigarrow a_{m+1} b_{m,1} \cdots b_{m,m},\\
b_{m,j} &\rightsquigarrow a_{m+1-j} c_{m+2-j,2} \cdots c_{m,j} b_{m+1,j} b_{m+1-j,1} \cdots b_{m+1-j,m+1-j}, \quad 1 \le j \le m,\\
c_{m,j} &\rightsquigarrow a^2_{m+2-j} c_{m+3-j,2} \cdots c_{m,j-1} b_{m+1-j,1} \cdots b_{m+1-j,m+1-j}, \quad 2 \le j \le m,
\end{aligned}$$

where $a_m = 0^m$*,* $b_{m,j} = a_m j$*, and* $c_{m,j} = a_m j0$*.*
(3) *The rules of the generating tree* $\mathcal{T}(\{101, 110, 120, 201\})$ *are*

$$\begin{aligned}
a_m &\rightsquigarrow a_{m+1} b_{m,1} \cdots b_{m,m},\\
b_{m,j} &\rightsquigarrow a_{m+2-j} c_{m+1-j,1} \cdots c_{m,j} b_{m+1-j,1} \cdots b_{m+1-j,m+1-j}, \quad 1 \le j \le m,\\
c_{m,j} &\rightsquigarrow c_{m+2-j,1} \cdots c_{m-1,j-1} c_{m+2-j,1} a_{m+2-j} b_{m+1-j,1} \cdots b_{m+1-j,m+1-j},\\
&\qquad 1 \le j \le m,
\end{aligned}$$

where $a_m = 0^m$*,* $b_{m,j} = a_m j$*, and* $c_{m,j} = a_m j(j-1)$*.*

We have the following characterizations whose straightforward proofs are left to the reader.

Lemma 13. *Suppose $e \in \mathbf{I}_n$ and $\mathbf{m_1}\pi_\mathbf{1}\mathbf{m_2}\pi_\mathbf{2}\ldots\mathbf{m_k}\pi_\mathbf{k}$ is the LRmax decomposition of e. Then $e \in \mathbf{I}_n(\{101, 100, 120, 201\})$ if and only if*
(i) for $1 \le i \le k-1$, we have $\mathbf{m_i} \le \pi_\mathbf{i+1}$ and, further, $\mathbf{m_i} < \pi_\mathbf{i+1}$ unless every entry of π_i is equal to m_i, and
(ii) each $\mathbf{m_i}\pi_\mathbf{i}$ starts with one or more occurrences of $\mathbf{m_i}$ and thereafter is strictly decreasing.

Lemma 14. *Suppose $e \in \mathbf{I}_n$ and $\mathbf{m_1}\pi_\mathbf{1}\mathbf{m_2}\pi_\mathbf{2}\ldots\mathbf{m_k}\pi_\mathbf{k}$ is the LRmax decomposition of e. Then $e \in \mathbf{I}_n(\{101, 110, 120, 201\})$ if and only if*
(i) for $1 \le i \le k-1$, we have $\mathbf{m_i} \le \pi_\mathbf{i+1}$ and, further, $\mathbf{m_i} < \pi_\mathbf{i+1}$ unless every entry of π_i is equal to m_i, and
(ii) each $\mathbf{m_i}\pi_\mathbf{i}$ consists of a sequence of one or more letters that are strictly decreasing except that the last letter may be repeated indefinitely.

Here is the bijection, with an obvious inverse. For each π_i, if all its letters are $\mathbf{m_i}$ leave π_i intact, otherwise, let $a < \mathbf{m_i}$ denote its last letter, set $b = \mathbf{m_i}$, and transfer all (if any) occurrences of b at the start of π_i to the end, changing them from b to a. For example, with the first occurrence of each noninitial left-to-right maximum circled

$$0\,0\,2\,2\,2\,1\,0\,5\,4\,3\,8\,8\,8\,9\,9\,8 \to 0\,0\,2\,1\,0\,0\,0\,5\,4\,3\,8\,8\,8\,9\,8\,8\,.$$

4.10. Class 207: $\{100, 101, 110, 210\} \overset{\mathbf{I}}{\sim} \{100, 101, 110, 201\}$

We have the following characterization of inversion sequences avoiding $\{100, 101, 110\}$.

Lemma 15. *Suppose $e \in \mathbf{I}_n$ and $0^{r_1} m_2^{r_2}\pi_2 \ldots m_k^{r_k}\pi_k$ is the strict LRmax decomposition of e. Then $e \in \mathbf{I}_n(\{100, 101, 110\})$ if and only if*
(i) for $2 \le i \le k$, either m_i occurs only once in e or each occurrence of m_i is a weak right-to-left min in e (that is, less than equal to all following letters), and
(ii) the concatenation $\pi_2 \ldots \pi_k$ consists of distinct letters.

Lemma 16. *Suppose $e \in \mathbf{I}_n(\{100, 101, 110\})$ and $0^{r_1} m_2^{r_2}\pi_2 \ldots m_k^{r_k}\pi_k$ is the strict LRmax decomposition of e. Then*
(i) $e \in \mathbf{I}_n(\{100, 101, 110, 210\})$ if and only if the concatenation $\pi_2 \ldots \pi_k$ is (strictly) increasing, and
(ii) $e \in \mathbf{I}_n(\{100, 101, 110, 201\})$ if and only if, for $i = 2, \ldots, k$, the entries in the concatenation $\pi_2 \ldots \pi_k$ that are less than m_i form a decreasing list.

Here is the bijection. In the strict LRmax decomposition $0^{r_1} m_2^{r_2}\pi_2 \ldots m_k^{r_k}\pi_k$ of $e \in \mathbf{I}_n(\{100, 101,\ 110, 210\})$, consider the π's as a set of filled boxes with one entry in each box. Remove the entries from all boxes and refill the boxes left to right, using the largest available entry that is less than m_i when the box is in π_i.

For example, with the first occurrence of each left-to-right max circled and the π's underlined,

$$0^5\; 6\; \underline{0\,1}\; 7\; 8\; \underline{2\,3}\; 12\; \underline{4\;5\;10}\; 15\; \underline{11\,13\,14}\; 16\; 16\; 17$$
$$\mapsto 0^5\; 6\; \underline{5\,4}\; 7\; 8\; \underline{3\,2}\; 12\; \underline{11\,10\,1}\; 15\; \underline{14\;13\;0}\; 16\; 16\; 17.$$

The inverse is obvious: identify the π's and then rearrange their entries in increasing order.
