

## 15.1: Double Integrals over Rectangles

Marius Ionescu

November 14, 2012

## Volumes and Double Integrals

- Let  $f$  be a function of two variables defined on a closed rectangle:

$$R = \{(x, y) \in \mathbb{R}^2 : a \leq x \leq b, c \leq y \leq d\}$$

- The graph of  $f$  is a surface with equation  $z = f(x, y)$ .
- The solid  $S$  that lies above  $R$  and under the graph of  $f$  is

$$S = \{(x, y, z) \in \mathbb{R}^3 : 0 \leq z \leq f(x, y), (x, y) \in R\}$$

## The Volume

- To find the volume of  $S$  we divide the rectangle  $R$  into subrectangles

$$R_{ij} = \{(x, y), : x_i \leq x \leq x_{i+1}, y_j \leq y \leq y_{j+1}\}.$$

- Choose a **sample point**  $(x_{ij}^*, y_{ij}^*)$  in each  $R_{ij}$
- The volume of  $S$  is approximated by

$$V \simeq \sum_{i=1}^m \sum_{j=1}^n f(x_{ij}^*, y_{ij}^*) \Delta A.$$

## The Double Integral

### Definition

The **double integral** of  $f$  over the rectangle  $R$  is

$$\iint_R f(x, y) dA = \lim_{m, n \rightarrow \infty} \sum_{i=1}^m \sum_{j=1}^n f(x_{ij}^*, y_{ij}^*) \Delta A.$$

Notes

---

---

---

---

---

---

---

---

---

---

## Volume = Double Integral

### Fact

If  $f(x, y) \geq 0$ , then the volume  $V$  of the solid that lies above the rectangle  $R$  and below the surface  $z = f(x, y)$  is

$$V = \iint_R f(x, y) dA.$$

Notes

---

---

---

---

---

---

---

---

---

---

## Example

### Example

Estimate  $\iint_R (1 - xy^2) dA$ , where  $R = [0, 4] \times [-1, 2]$ ; use a Riemann sum with  $m = 2$  and  $n = 3$ .

Notes

## Midpoint Rule for Double Integrals

Fact

$$\iint_r f(x, y) dA \simeq \sum_{i=1}^m \sum_{j=1}^n f(\bar{x}_i, \bar{y}_j) \Delta A,$$

where  $\bar{x}_i$  is the midpoint of  $[x_{i-1}, x_i]$  and  $\bar{y}_j$  is the midpoint of  $[y_{j-1}, y_j]$ .

## Example

Example

Use the Midpoint Rule with  $m = n = 2$  to estimate the value of the integral  $\iint_R (x - 3y^2) dA$ , where  $R = \{(x, y) : 0 \leq x \leq 2, 1 \leq y \leq 2\}$ .
