Problem 1 (Exercise 1.4.2 on page 27). Recall that $\mathbb{I}$ stands for the set of irrational numbers.

(a) Show that if $a, b \in \mathbb{Q}$, then $ab$ and $a + b$ are elements of $\mathbb{Q}$ as well.
(b) Show that if $a \in \mathbb{Q}$ and $t \in \mathbb{I}$, then $a + t \in \mathbb{I}$ and $at \in \mathbb{I}$ as long as $a \neq 0$.
(c) Part (a) can be summarized by saying that $\mathbb{Q}$ is closed under addition and multiplication. Is $\mathbb{I}$ closed under addition and multiplication? Given two irrational numbers $s$ and $t$, what can we say about $s + t$ and $st$?

Problem 2 (Exercise 1.4.4 on page 27). Use the Archimedean Property of $\mathbb{R}$ to rigorously prove that $\inf\{1/n : n \in \mathbb{N}\} = 0$.

Problem 3 (Exercise 2.2.1 on page 43). Verify, using the definition of convergence of a sequence, that the following sequences converge to the proposed limit.

(a) $\lim_{n \to \infty} \frac{1}{6n^2 + 1} = 0$ .
(b) $\lim_{n \to \infty} \frac{3n+1}{2n+5} = \frac{3}{2}$ .
(c) $\lim_{n \to \infty} \frac{2}{\sqrt{n+3}} = 0$ .

Problem 4 (Exercise 2.2.2 on page 43). What happens if we reverse the order of the quantifiers in Definition 2.2.3?

Definition: A sequence $(x_n)$ converges to $x$ if there exists an $\varepsilon > 0$ such that for all $N \in \mathbb{N}$ it is true that $n \geq N$ implies $|x_n - x| < \varepsilon$.

Give an example of a convergent sequence. Can you give an example of a convergent sequence that is divergent? What exactly is being described in this strange definition?

Problem 5 (Exercise 2.2.6 on page 43). Suppose that for a particular $\varepsilon > 0$ we have found a suitable value of $N$ that “works” for a given sequence in the sense of Definition 2.2.3.

(a) Then, any larger/smaller pick one) $N$ will also work for the same $\varepsilon > 0$.
(b) Then, this same $N$ will also work for any larger/smaller value of $\varepsilon$. 

1
Problem 6 (Exercise 2.2.7 on page 45). Informally speaking, the sequence $\sqrt{n}$ "converges to infinity."

(a) Imitate the logical structure of Definition 2.2.3 to create a rigorous definition for the mathematical statement $\lim x_n = \infty$. Use this definition to prove $\lim \sqrt{n} = \infty$.

(b) What does your definition in (a) say about the particular sequence $\{1, 0, 2, 0, 3, 0, 4, 0, 5, 0 \ldots \}$?
